

Malic Acid in Personal Care Products

Improves Facial Skin Conditions

Malic Acid, an alpha hydroxy fruit acid, is used in various facial skin preparations to rejuvenate skin by a surface exfoliating action.

Improves Appearance and Production Efficiency of Moulded Denture Cleaning Tablets

Malic Acid is used as a component of moulded denture cleaning tablets because it **results in a harder and glossier finish** in the finished tablet. It also improves line efficiency in the moulding of the tablets. Malic Acid is used at levels exceeding 45% in denture cleaning tablets.

RECOMMENDATIONS FOR USE: The level of use depends on the application. Trials are normally run to determine the effectiveness of different treatments before using these on a commercial scale.
